

## Header | Delivery System™

### Delivering Pigs to Individual Heater Coils

- Innovative and inexpensive inspection and cleaning approach
- Live video monitoring system facilitates locating and mating with individual coils along the axial length of the header
- Significantly reduces cleaning and inspection times using both mechanical and intelligent pigs
- Lighter weight allows operation by only two technicians
- Each HDS is custom-engineered and tested for optimal performance and fast inspection
- Reconfigurable to accommodate different header diameters and lengths

Steady Flux's Header Delivery System™ (HDS) allows inspection and cleaning of inaccessible pipes without destructive intrusion. Fired heater downtime is significantly reduced compared to other cleaning and inspection approaches. There is no need to cut each individual coil and weld on flanges for intelligent pigging or cleaning pigs. Able to hold up to 500 psi of pressure, the HDS can be used in conjunction with all pigging operations. The HDS is a cost-effective way to clean and inspect pipes during your scheduled or emergency shutdown.
